To Whom It May Concern,

At Tulsa Combustion, we pride ourselves on solving novel and challenging problems, leveraging decades of pioneering expertise in combustion systems to drive practical, real-world advancements. With our in-house design, engineering, and manufacturing capabilities, and a track record of collaborating on some of the industry's most complex projects, we are uniquely positioned to lead in the growing field of hydrogen combustion.

Currently, hydrogen used in Tulsa is transported from Houston, where it is produced via the steam methane reforming (SMR) process—a method associated with high carbon emissions. For many of our clients pursuing decarbonization strategies, the availability of green hydrogen, produced without inherent carbon emissions, would enable them to meet their sustainability objectives from the outset. The transition to cleaner energy solutions is no longer an abstract goal; it is an urgent priority for the industries we serve.

Having worked directly with Colby on previous hydrogen projects, we have seen firsthand his depth of expertise and ability to navigate the complexities of the field. His understanding of hydrogen's pain points and potential solutions aligns perfectly with our vision of offering clients emission-free hydrogen as a competitive, sustainable alternative to fossil fuel-derived hydrogen.

The successful commercialization of this innovative green hydrogen technology would not only mark a significant milestone for renewable energy but could also help achieve parity—or better—with current market prices for SMR-derived hydrogen. From our perspective, this is a clear win-win scenario.

This letter serves to express our enthusiasm for the opportunity to integrate green hydrogen into our offerings. Should the product meet commercial viability and achieve competitive pricing, Tulsa Combustion would be eager to replace current carbon-intensive hydrogen purchases with emission-free hydrogen. In our view, adopting green hydrogen is a logical step forward, aligning with our mission to deliver superior, sustainable solutions while supporting our clients' decarbonization goals.

We are excited to support this venture and look forward to continuing to work with Colby and Tobe Energy as they redefine what's possible in renewable hydrogen technology.

Sincerely,
Mitt Chinsethagid
