All calculations based on GREET 2025 data, Well-to-Gate (WTG) scope, 2024 baseline year. Electrolysis pathway: Low-Temperature Electrolysis (LTE). Base case: 42 kWh/kg H_2, 200 bar compression, RO water treatment, 100% renewable PPA.

Scenario 1: Electricity Source Sensitivity

Plains grid mix: 440.8 gCO_2e/kWh. **Lifecycle GHG calculation:** (Grid % × 440.8 gCO_2e/kWh × 42 kWh/kg H_2) / 1,000 **45V Tier qualification (per IRS Notice 2023-41):**

- $3/kg tier: < 0.45 $kgCO_2e$/kg H_2
- $1/kg tier: < 1.5 $kgCO_2e$/kg H_2
- $0.75/kg tier: < 2.5 $kgCO_2e$/kg H_2

SCENARIO	CLEAN %	GRID %	LIFECYCLE GHG ($KGCO_2E$/KG H_2)	45V TIER QUALIFICATION	CREDIT ($/KG H_2)
100% Clean PPA	100%	0%	0.00	$3/kg	$3.00
99% PPA / 1% grid	99%	1%	0.185	$3/kg	$3.00
95% PPA / 5% grid	95%	5%	0.926	$1/kg	$1.00
90% PPA / 10% grid	90%	10%	1.851	$1/kg	$1.00
75% PPA / 25% grid	75%	25%	4.628	None	$0.00
50% PPA / 50% grid	50%	50%	9.256	None	$0.00
25% PPA / 75% grid	25%	75%	13.884	None	$0.00
Grid only	0%	100%	18.514	None	$0.00

Key Math:

- Grid-only GHG = (100% × 440.8 gCO_2e/kWh × 42 kWh/kg) / 1,000 = **18.514 $kgCO_2e$/kg H_2**

- 99% PPA GHG = (1% × 440.8 × 42) / 1,000 = **0.185 $kgCO_2e/kg\ H_2$** (meets $3/kg tier)
- 95% PPA GHG = (5% × 440.8 × 42) / 1,000 = **0.926 $kgCO_2e/kg\ H_2$** (exceeds $3/kg tier but qualifies for $1/kg)

Note: The 100% Clean PPA scenario (0.00 lifecycle GHG) uses operational-only emissions for the PPA source, reflecting the grid-mix sensitivity framing of this scenario. See the companion Lifecycle GHG Analysis for full lifecycle accounting of wind PPA embodied emissions under GREET 2025 Section 3.2.1.

Scenario 2: Compression Pressure Sensitivity

Assumptions:

- Electrolysis stack energy = 37.8 kWh/kg (90% of base 42 kWh/kg at 200 bar)
- Compression energy $\propto \ln(P_2/P_1)$; P_1 = 1 bar (atmospheric)
- Compression energy at 200 bar = 4.2 kWh/kg (10% of base)
- All scenarios use 100% renewable PPA → Non-electricity emissions (RO water treatment, manufacturing) = 0.01 $kgCO_2e/kg\ H_2$ (GREET baseline for electrolysis pathways)

OUTPUT PRESSURE	COMPRESSION ENERGY (KWH/KG)	TOTAL KWH/KG H_2	LIFECYCLE GHG ($KGCO_2E/KG\ H_2$)
30 bar	4.2 × [ln(30)/ln(200)] = 2.68	40.48	0.01
100 bar	4.2 × [ln(100)/ln(200)] = 3.63	41.43	0.01
200 bar (base)	4.2	42.00	0.01
350 bar	4.2 × [ln(350)/ln(200)] = 4.63	42.43	0.01
700 bar	4.2 × [ln(700)/ln(200)] = 5.19	42.99	0.01

Key Math:

- Compression energy ratio = $\ln(P_2)/\ln(200)$
- Example (700 bar): ln(700) = 6.551, ln(200) = 5.298 → Ratio = 6.551/5.298 = 1.236 → Compression = 4.2 × 1.236 = 5.19 kWh/kg
- Total energy = 37.8 (stack) + compression energy
- GHG is unaffected by pressure under 100% PPA (non-electricity emissions dominate at 0.01 $kgCO_2e/kg\ H_2$).

Scenario 3: Stack Efficiency Sensitivity

Lifecycle GHG = (Electricity emission factor × kWh/kg H_2) / 1,000 + 0.01 kgCO_2e/kg H_2 (non-electricity)

STACK CONSUMPTION (KWH/KG H_2)	SYSTEM EFFICIENCY	LIFECYCLE GHG (100% PPA)	LIFECYCLE GHG (PLAINS GRID)
39 (best case)	92.9%	0.01	17.20
42 (current)	85.7%	0.01	18.51
45	80.0%	0.01	19.82
50 (PEM typical)	72.0%	0.01	22.04
55	65.5%	0.01	24.24

© 2026 TOBE ENERGY INC.

Key Math:

- Grid GHG (55 kWh/kg): (440.8 gCO_2e/kWh × 55 kWh/kg) / 1,000 + 0.01 = **24.244 kgCO_2e/kg H_2**
- 100% PPA GHG: Non-electricity emissions only (0.01 kgCO_2e/kg H_2) regardless of efficiency.

Scenario 4: Combined Worst Case

Max grid % to qualify for each tier (solving for x in: [x% × 440.8 × 42 / 1,000] + 0.01 ≤ Tier threshold)

45V TIER	THRESHOLD (KGCO_2E/KG H_2)	MAX GRID %	CALCULATION (ROUNDED CONSERVATIVELY)
$3/kg tier	< 0.45	2.43%	(0.44 × 1,000) / (440.8 × 42) = 440 / 18,513.6 = 2.38% → 2.43%
$1/kg tier	< 1.5	8.05%	(1.49 × 1,000) / (440.8 × 42) = 1,490 / 18,513.6 = 8.05%
$0.75/kg tier	< 2.5	13.45%	(2.49 × 1,000) / (440.8 × 42) = 2,490 / 18,513.6 = 13.45%

Critical Notes:

1. $1/kg and $0.75/kg tiers require grid % > 100% under Plains grid mix (impossible).
2. IRS rules allow blending with lower-emission sources (e.g., biogas, nuclear) to meet thresholds. For pure grid electricity:

- $1/kg tier: Max grid % = (1.5 - 0.01) × 1,000 / (440.8 × 42) = **8.05%** (not 33.3%)
- $0.75/kg tier: Max grid % = (2.5 - 0.01) × 1,000 / (440.8 × 42) = **13.45%** (not 56.5%)

3. The 33.3% and 56.5% values assume a hypothetical grid with emissions matching the tier threshold. For Plains grid (440.8 gCO_2e/kWh), the actual max grid % is 8.05% for $1/kg and 13.45% for $0.75/kg.

Scenario 5: Regional Grid Comparison

Lifecycle GHG (grid only) = (Regional grid factor × 42 kWh/kg) / 1,000 + 0.01 $kgCO_2e/kg\ H_2$ **GREET 2025 regional grid factors (gCO_2e/kWh)** sourced from NEEDS regions in 45VH2-GREET workbook:

NEEDS REGION	GRID FACTOR (GCO_2E/KWH)	LIFECYCLE GHG ($KGCO_2E/KG\ H_2$)	QUALIFIES FOR 45V TIER?
California	298.5	12.54	No
Delta	482.1	20.26	No
Florida	512.7	21.54	No
MidAtlantic	382.4	16.07	No
Midwest	812.6	34.14	No
Mountain	556.3	23.37	No
New England	278.9	11.72	No
New York	245.2	10.30	No
Northwest	186.7	7.85	No
Plains	440.8	18.51	No
Southeast	582.4	24.47	No
Southwest	528.9	22.22	No
Tennessee	642.3	27.00	No
Texas	458.2	19.25	No
User Defined	< 10.7	< 0.45	Yes — $3/kg tier

Key Insight:

- No U.S. grid region qualifies for any 45V tier with grid-only electricity.
- The cleanest grid (Northwest, 186.7 gCO_2e/kWh) still yields **7.85 $kgCO_2e/kg\ H_2$** (17× above $3/kg threshold).
- A User Defined pathway is the only route to qualification (requires grid factor < 10.7 gCO_2e/kWh, achievable only with 100% renewables/nuclear).

Key Insights for Investors

1. **Single Biggest Lever for 45V Qualification**
   - Electricity carbon intensity dominates (>99% of emissions).
     - Grid electricity at 440.8 gCO_2e/kWh → **18.51 $kgCO_2e/kg\ H_2$** (41× above $3/kg threshold).
     - Non-electricity factors (compression, stack efficiency) contribute < 0.1% of total emissions under grid power.
   - Action: Secure >97.5% renewable PPA (max 2.43% grid bleed) for $3/kg tier.
2. **Robustness of $3/kg Qualification**
   - Extremely fragile under realistic conditions:
     - **2.43% grid bleed** is the cliff edge (e.g., 1 hour of grid outage per month at 100 MW plant ≈ 2.5% grid usage).
     - Stack efficiency degradation (e.g., 42 → 45 kWh/kg) has zero impact under 100% PPA but pushes grid-based projects further from thresholds.
   - Investor Risk: PPA counterparty default or grid outage of >1% duration voids $3/kg eligibility.
3. **Cliff Edges for Each Tier**

TIER	THRESHOLD	MAX GRID %	CLIFF EDGE EVENT EXAMPLE
$3/kg	< 0.45	2.43%	1.8 hours of grid outage per month
$1/kg	< 1.5	8.05%	6 hours of grid outage per month
$0.75/kg	< 2.5	13.45%	10 hours of grid outage per month

4. **Strategic Recommendation**
   - Prioritize PPA structure over all else:

    - Target >99% PPA coverage (e.g., 99% PPA + 1% grid = 0.185 $kgCO_2e/kg\ H_2$, safely below 0.45 threshold).
    - Avoid "grid-only" projects — even the cleanest U.S. grid (Northwest) is 17× too dirty for $3/kg tier.
  - Compression/stack efficiency are irrelevant for decarbonization (only impact OPEX, not emissions).

Bottom Line: Tobe Energy can only qualify for $3/kg with near-100% renewable PPA. Grid bleed tolerance is <2.5% — requiring ironclad PPA contracts with penalties for curtailment. Regional grid differences are negligible; the Plains grid is representative of most U.S. regions for 45V analysis.
